

## TSB: Using Jumper Wire to switch from Reverse to Normal View (GT Series Car Cameras)

Factory default setup for all GT Series cameras is REVERSE view (mirror image), suitable backup camera mounting. Most models include a jumper wire to change the image to NORMAL view, desirable when mounting the camera looking forward. There are two types of jumper wire connections. Directions are listed separately for each type.

**JUMPER PIN:** *Normally closed circuit.* Remove jumper plug from pins to switch from mirror to normal view. **Important-** insulate exposed pin ends with tape before mounting camera.

**GREEN WIRES:** *Normally open circuit.* Solder wires together to switch from mirror to normal view. **Important - insulate** exposed ends with tape before mounting camera.
